

Amendments to the Claims

This listing of claims replaces all prior versions and listings of claims in the application.

Listing of Claims

1. (Currently amended) A method of manufacturing a semiconductor device comprising the steps of:

forming a crystalline semiconductor film on an insulating surface;
forming an insulating film on said crystalline semiconductor film;
introducing a dopant impurity into said crystalline semiconductor film through said insulating film by an ion doping;

annealing said crystalline semiconductor film to repair lattice defects caused by the introduction of the dopant impurity;

forming a gate electrode over said insulating film, and
forming a channel region in the doped region of the crystalline semiconductor film, wherein a peak of a concentration profile of said dopant impurity is located in said insulating film.

2. (Original) A method according to claim 1 wherein said insulating film comprises silicon oxide.

3. (Canceled)

4. (Previously Presented) A method according to claim 1 wherein said dopant impurity is boron.

5. (Original) A method according to claim 1 wherein said crystalline semiconductor film comprises polycrystalline silicon.

6. (Canceled)

7. (Original) A method according to claim 4 wherein said boron is supplied by diborane gas.

8. (Original) A method according to claim 1 further comprising a step of removing said insulating film.

9. (Original) A method according to claim 1 wherein said semiconductor device comprises an active matrix display device having thin-film transistors.

10. (Original) A method according to claim 1 wherein said semiconductor device comprises a shift register circuit having thin-film transistors.

11. (Original) A method according to claim 1 further comprising a step of irradiating a laser light to said crystalline semiconductor film.

12. (Withdrawn) A method of manufacturing a semiconductor device comprising the steps of:

forming a crystalline semiconductor film on an insulating substrate;

forming an insulating film on said semiconductor film;

introducing a dopant impurity into said semiconductor film through said insulating film by ion doping; and

irradiating a laser light to said semiconductor film to activate said dopant impurity, wherein a peak of a concentration profile of said dopant impurity is located in said insulating surface.

13. (Withdrawn) A method according to claim 12 wherein said insulating film comprises silicon oxide.

14. (Canceled)

15. (Withdrawn) A method according to claim 12 wherein said dopant impurity is boron.

16. (Withdrawn) A method according to claim 12 wherein said semiconductor film comprises polycrystalline silicon.

17. (Canceled)

18. (Withdrawn) A method according to claim 15 wherein said boron is supplied by diborane gas.

19. (Withdrawn) A method according to claim 12 further comprising a step of removing said insulating film.

20. (Withdrawn) A method according to claim 12 wherein said semiconductor device comprises active matrix devices made of thin-film transistors.

21. (Withdrawn) A method according to claim 12 wherein said semiconductor device comprises a shift resistor circuits made of thin-film transistors.

22. (Withdrawn) A method of manufacturing a semiconductor device comprising the steps of:

- forming a crystalline semiconductor film on an insulating surface;
- forming an insulating film on said crystalline semiconductor film;
- introducing a first dopant impurity into said crystalline semiconductor film through said insulating film by a first ion doping;
- annealing said crystalline semiconductor film;
- forming a gate electrode over said insulating film, and
- forming a channel region in the doped region of the crystalline semiconductor film,

introducing a second dopant impurity into said crystalline semiconductor film by a second ion doping by using the gate electrode as a mask,

wherein a peak of a concentration profile of said first dopant impurity is located above said insulating surface.

23. (Withdrawn) A method according to claim 22 wherein said insulating film comprises silicon oxide.

24. (Canceled)

25. (Withdrawn) A method according to claim 22 wherein said first dopant impurity is boron.

26. (Withdrawn) A method according to claim 22 wherein said crystalline semiconductor film comprises polycrystalline silicon.

28. (Withdrawn) A method according to claim 25 wherein said boron is supplied by diborane gas.

29. (Withdrawn) A method according to claim 22 further comprising a step of removing said insulating film.

30. (Withdrawn) A method according to claim 22 wherein said semiconductor device comprises an active matrix display device having thin-film transistors.

31. (Withdrawn) A method according to claim 22 wherein said semiconductor device comprises a shift register circuit having thin-film transistors.

32. (Withdrawn) A method according to claim 22 further comprising a step of irradiating a laser light to said crystalline semiconductor film.

33. (Withdrawn) A method of manufacturing a semiconductor device comprising the steps of:

forming a crystalline semiconductor film on an insulating surface;
forming an insulating film on said crystalline semiconductor film;
introducing a dopant impurity into said crystalline semiconductor film through said insulating film by an ion doping; and
irradiating a laser light to said semiconductor film to activate said dopant impurity,
wherein a peak of a concentration profile of said dopant impurity is located above said insulating surface.

34. (Withdrawn) A method according to claim 33 wherein said insulating film comprises silicon oxide.

35. (Canceled)

36. (Withdrawn) A method according to claim 33 wherein said dopant impurity is boron.

37. (Withdrawn) A method according to claim 33 wherein said semiconductor film is a polycrystalline semiconductor film.

38. (Canceled)

39. (Withdrawn) A method according to claim 36 wherein said boron is supplied by diborane gas.

40. (Withdrawn) A method according to claim 33 further comprising a step of removing said insulating film.

41. (Withdrawn) A method according to claim 33 wherein said semiconductor device comprises active matrix devices made of thin-film transistors.

42. (Withdrawn) A method according to claim 33 wherein said semiconductor device comprises a shift resistor circuits made of thin-film transistors.

43. (Withdrawn) A method of manufacturing a semiconductor device comprising the steps of:

forming a crystalline semiconductor film having a portion to become a channel region on an insulating surface;

forming an insulating film on said crystalline semiconductor film;

introducing a first dopant impurity into at least said portion through said insulating film by an a first ion doping;

annealing said crystalline semiconductor film;

forming a gate electrode over said portion through said insulating film, and

forming a channel region in the doped region of the crystalline semiconductor film, introducing a second dopant impurity into said crystalline semiconductor film by a second ion doping by using the gate electrode as a mask,

wherein a peak of a concentration profile of said first dopant impurity is located in said insulating film.

44. (Withdrawn) A method according to claim 43 wherein said semiconductor device comprises an active matrix display device having thin-film transistors.

45. (Withdrawn) A method according to claim 43 wherein said semiconductor device comprises a shift register circuit having thin-film transistors.

46. (Withdrawn) A method according to claim 43 wherein said concentration is within a range from 5×10^{15} atoms/cm³ to 5×10^{17} atoms/cm³.

47. (Withdrawn) A method according to claim 43 further comprising a step of irradiating a laser light to said crystalline semiconductor film.

48. (Withdrawn) A method of manufacturing a semiconductor device comprising the steps of:

forming a crystalline semiconductor film on an insulating substrate;

forming an insulating film on said semiconductor film;

introducing a dopant impurity into said semiconductor film through said insulating film by ion doping; and

irradiating a laser light to said semiconductor film to activate said dopant impurity,

wherein a peak of a concentration profile of said dopant impurity is located in said insulating surface.

49. (Withdrawn) A method according to claim 48 wherein said semiconductor device comprises active matrix devices made of thin-film transistors.

50. (Withdrawn) A method according to claim 48 wherein said semiconductor device comprises a shift resistor circuits made of thin-film transistors.

51. (Withdrawn) A method according to claim 48 wherein said concentration is within a range from 5×10^{15} atoms/cm³ to 5×10^{17} atoms/cm³.

52. (Withdrawn) A method of manufacturing a semiconductor device comprising the steps of:

forming a crystalline semiconductor film having a portion to become a channel region on an insulating surface;

forming an insulating film on said crystalline semiconductor film;

introducing a first dopant impurity into at least said portion through said insulating film by an a first ion doping;

annealing said crystalline semiconductor film;

forming a gate electrode over said portion through said insulating film, and

forming a channel region in the doped region of the crystalline semiconductor film, introducing a second dopant impurity into said crystalline semiconductor film by a second ion doping by using the gate electrode as a mask,

wherein a peak of a concentration profile of said first dopant impurity is located above said insulating surface.

53. (Withdrawn) A method according to claim 52 wherein said semiconductor device comprises an active matrix display device having thin-film transistors.

54. (Withdrawn) A method according to claim 52 wherein said semiconductor device comprises a shift register circuit having thin-film transistors.

55. (Withdrawn) A method according to claim 52 wherein said concentration is within a range from 5×10^{15} atoms/cm³ to 5×10^{17} atoms/cm³.

56. (Withdrawn) A method according to claim further comprising a step of irradiating a laser light to said crystalline semiconductor film.

57. (Withdrawn) A method of manufacturing a semiconductor device comprising the steps of:

forming a crystalline semiconductor having a portion to become a channel region on an insulating surface;

forming an insulating film on said semiconductor film;

introducing a dopant impurity into said semiconductor film through said insulating film by ion doping; and

irradiating a laser light to said semiconductor film to activate said dopant impurity,

wherein a peak of a concentration profile of said dopant impurity is located in said insulating surface.

58. (Withdrawn) A method according to claim 57 wherein said semiconductor device comprises active matrix devices made of thin-film transistors.

59. (Withdrawn) A method according to claim 57 wherein said semiconductor device comprises a shift register circuit having thin-film transistors.

60. (Withdrawn) A method according to claim 57 wherein said concentration is within a range from 5×10^{15} atoms/cm³ to 5×10^{17} atoms/cm³.

61. (Withdrawn) A method according to claim 1 wherein said annealing step is conducted by a heating.

62. (Withdrawn) A method according to claim 22 wherein said annealing step is conducted by a heating.

63. (Withdrawn) A method according to claim 43 wherein said annealing step is conducted by a heating.

64. (Withdrawn) A method according to claim 52 wherein said annealing step is conducted by a heating.

65. (Withdrawn) A method of manufacturing a semiconductor device having a thin film transistor comprising the steps of:

- forming a crystalline semiconductor film on an insulating surface;
- forming an insulating film on said crystalline semiconductor film;
- introducing a first dopant impurity into at least a portion of said crystalline semiconductor film through said insulating film by an a first ion doping;
- removing said insulating film after said introducing step;
- annealing said crystalline semiconductor film after said removing step, and
- forming a channel region in the doped region of the crystalline semiconductor film,

introducing a second dopant impurity into said crystalline semiconductor film by a second ion doping by using the gate electrode as a mask,

wherein said portion constitutes a said channel region of said thin film transistor,
wherein a peak of a concentration profile of said first dopant impurity is located in said insulating film.

66. (Withdrawn) A method according to claim 65 wherein said insulating film comprises silicon oxide.

67. (Withdrawn) A method according to claim 65 wherein said first dopant impurity is boron.

68. (Withdrawn) A method according to claim 65 wherein said crystalline semiconductor film comprises polycrystalline silicon.

69. (Withdrawn) A method according to claim 67 wherein said boron is supplied by diborane gas.

70. (Withdrawn) A method according to claim 65 wherein said semiconductor device comprises an active matrix display device having thin-film transistors.

71. (Withdrawn) A method according to claim 65 wherein said semiconductor device comprises a shift register circuit having thin-film transistors.

72. (Withdrawn) A method according to claim 65 further comprising a step of irradiating a laser light to said crystalline semiconductor film.

73. (Withdrawn) A method according to claim 65 wherein said annealing step is conducted by a heating.

74. (Withdrawn) A method of manufacturing a semiconductor device having a thin film transistor comprising the steps of:

- forming a crystalline semiconductor film on an insulating surface;
- forming an insulating film on said crystalline semiconductor film;
- introducing a first dopant impurity into at least a portion of said crystalline semiconductor film through said insulating film by an a first ion doping;
- removing said insulating film after said introducing step;
- annealing said crystalline semiconductor film after said removing step, and
- forming a channel region in the doped region of the crystalline semiconductor film,

introducing a second dopant impurity into said crystalline semiconductor film by a second ion doping,

- wherein said portion constitutes a said channel region of said thin film transistor,
- wherein a peak of a concentration profile of said first dopant impurity is located above said insulating surface.

75. (Withdrawn) A method according to claim 74 wherein said insulating film comprises silicon oxide.

76. (Withdrawn) A method according to claim 74 wherein said first dopant impurity is boron.

77. (Withdrawn) A method according to claim 74 wherein said crystalline semiconductor film comprises polycrystalline silicon.

78. (Withdrawn) A method according to claim 76 wherein said boron is supplied by diborane gas.

79. (Withdrawn) A method according to claim 74 wherein said semiconductor device comprises an active matrix display device having thin-film transistors.

80. (Withdrawn) A method according to claim 74 wherein said semiconductor device comprises a shift register circuit having thin-film transistors.

81. (Withdrawn) A method according to claim 74 further comprising a step of irradiating a laser light to said crystalline semiconductor film.

82. (Canceled)

83. (New) A method according to claim 1 wherein forming said insulating film on said crystalline semiconductor film comprises controlling a thickness of said insulating film so that the peak of the concentration profile of the dopant impurity is located in said insulating film.
